## LETTER FROM THE EXECUTIVE DIRECTOR

## Coffee Market Report

January 2010

The upward trend in coffee prices recorded in December2009 continued during the first fortnight of 2010, with the monthly average of the ICO composite indicator price in January rising to 126.85 US cents per lb compared to 124.96 US cents per lb in December 2009. The increase was particularly marked in the case of Colombian Milds, widening the differential with the average of the $2^{\text {nd }}$ and $3^{\text {rd }}$ positions on the New York futures market. During the last few months, the differential between prices of Arabicas and Robustas has widened significantly. Nonetheless, during the second half of January prices were subject to some downward corrections, partly as a consequence of the appreciation of the United States dollar.

Supplies of Arabicas from South and Central America are facing both climatic and structural difficulties, particularly with the recurrence of the coffee berry borer in Colombia. Prospects for a return of Colombian production to its normal level following a poor performance in 2008/09 are once more uncertain and the production in January was very low. The possibility of substitution by other origins seems equally limited.

Exports by all exporting countries during December 2009 totalled 7.8 million bags, bringing the cumulative total for calendar year 2009 to 94.7 million bags compared to total exports of 97.7 million bags in 2008, a fall of $3 \%$.

2 January 2009-5 February 2010

## Price movements

The monthly average of the ICO composite indicator price was 126.85 US cents per lb in January 2010 compared to 124.96 US cents per lb in December 2009, representing a slight increase of 1.5\% (Table 1). This is the highest monthly average since August 2008 and represents an increase of $17 \%$ in relation to January 2009. However, prices fell slightly during the second half of January, partly as a result of movements in the value of the US dollar, which generally appreciated against the currencies of exporting countries, particularly the Brazilian real.

Graph 1 shows changes in the ICO daily composite indicator price since 2 January 2009. Graph 2 shows daily indicator prices for the four groups of coffee since 2 January 2009. During the whole of calendar year 2009 Arabica prices were much firmer than those of Robustas, which found it difficult to sustain a level of more than 70 US cents per lb, widening the differential between the two types of coffee.

In thousand bags

## Market fundamentals

On the basis of available information production in crop year 2009/10 is estimated at 123.6 million bags compared to 128.2 million bags in 2008/09 (Table 3). This estimate is preliminary since additional information, mainly from Colombia and Vietnam, is pending. During crop year 2009/10 Colombia will not be able to recover its normal production after the decrease in 2008/09, given the combination of climatic problems and the occurrence of coffee pests.

In Brazil, where the harvest of the 2009/10 crop is complete, a fall in production of more than $14 \%$ compared to 2008/09 has been reported. Falls in production are also envisaged in a number of other countries, particularly in Africa (Côte d'Ivoire, Tanzania and Uganda), Asia (Papua New Guinea and Vietnam), Mexico and Central America (El Salvador and Mexico), and South America (Ecuador and Peru). In the case of Colombia, although an improvement had been expected during crop year 2009/10 compared to 2008/09, the size of the crop for the first three months (October - December) is below the level for the same period in 2008/09. Moreover, with factors such as a prolonged dry season and high levels of coffee berry borer infestation, there appears to be little possibility of an increase in production. In these circumstances, world coffee supply could be tight in 2010 since opening stocks are at low levels and climatic factors may affect crop quality. Apart from Indonesia, there are no significant increases in the production of other exporting countries which would be sufficient to offset the reduced production of countries experiencing supply problems.

In the case of crop year 2010/11, the Brazilian coffee authorities have published preliminary estimates for the crop year beginning in April. According to these estimates Brazilian production in crop year 2010/11, which is the high-yielding year for Arabicas in the biennial production cycle, will be between 45.9 and 48.7 million bags, comprising 34 to 36.2 million bags of Arabicas and 11.9 to 12.5 million bags of Robustas.

Exports during December totalled 7.8 million bags, bringing the total volume exported during calendar year 2009 to 94.7 million bags as against 97.7 million bags in 2008, a decrease of $3 \%$ (Table 4). Arabica exports were down by $5.2 \%$ while those of Robustas were slightly up ( $+0.9 \%$ ).

Timor-Leste, Trinidad and Tobago and Yemen

World consumption in calendar year 2008 is estimated at 130 million bags compared to 128 million bags in 2007 (Table 5). Domestic consumption in exporting countries is increasing steadily, rising to 36.7 million bags in 2008 from 35.4 million in 2007. In calendar year 2008 domestic consumption in Brazil accounted for $48 \%$ of total domestic consumption in exporting countries and $13.5 \%$ of world consumption. A recent study by ABIC, the Brazilian Coffee Industry Association, concludes that consumption growth remained strong in 2009, rising by $4.15 \%$. For calendar year 2009, my estimate of world consumption is around 132 million bags.

In conclusion, I think that market fundamentals continue to support firm prices, particularly in the case of Arabicas since supplies of good quality coffee are experiencing difficulties as a result of adverse weather conditions. In the short-term, coffee prices will continue to be influenced by oscillations in the value of the United States dollar against the currencies of exporting countries.
